c. Sample size

NSES has been conducted since 1963, yet the coverage at that time was only Java with the sample size of 16,000 households. Gradually, in 1964, 1967, 1969, 1976, 1978, 1979, 1981, 1989, and 1992 the NSES coverage and sample size varied and finally the survey now covers the whole of Indonesia. Since 1993, *SUSENAS* data were distinguished between core and module questionnaires. Module questionnaire cover cultural social module and education, housing and health, and consumption and expenditure modules that are only collected every three (3) years.

Core sample size varies ranging from 202,500 households in 1993 to 278,352 households in 2006. Prior 2004 the NSES enumeration was carried out during January-February; since 2005 it is done in the period of June to July. Basically, this survey is aimed to collect data on the socio-economic situation among people in Indonesia. However, the information regarding labour force are also collected, especially in the 1982 NSES when the labour force was set to be the main module. NSES was conducted in all provinces (27) and covered 60,400 households in 1982. Starting in 1992 and at least until 1995, the number of households selected was enlarged to 206,076. It is expected that from this large survey, parameters for smaller areas (regency instead of province) can be estimated.

c. Sample size: 207,000 Households (1995) 125.400 pada tahun 1985

The Inter-censal Population Survey (nationally referred to as *SUPAS*) is a population survey carried out between two population censuses. As the Population Census in Indonesia is conducted every ten years, consequently the IPS is also carried out every ten years, which was in 1976, 1985, 1995, and 2005. In 2005 *SUPAS* began to be piloted in Bengkulu, South Sulawesi and Papua, with a sample size of 1,728.

The sample frame used in *SUPAS 2005* is the list of census block in each district/municipal differentiated between urban and rural. The mapping of the census block in the *SUPAS 2005* used the one from the Population Census 2000. Two districts/municipalities are selected in each province, and each district/municipal is represented by three sub-districts (*kecamatan*), of which each is represented by three villages. In each village three block censuses are determined, in which 16 households for each block census are selected.³

The selection of census block is carried out using the Probability Proportional to Size-Linear Systematic Sampling that is each census block has a chance to be selected in proportion to the number of households.

Sample design: **The survey is based on a complete enumeration of large and medium-scale establishments**

Data Collection Method⁶

The Quarterly Large and Medium Manufacturing Industrial Survey is based on a sample basis, involving as much as 992 selected establishments. Data on Quarterly Large and Medium Manufacturing Industry Survey are collected in two ways. First, 797 establishments are compiled every quarter. Secondly the remaining establishments (195) are compiled every month. Furthermore, after three months the data which are collected monthly could be consolidated with data which are collected every quarter for computing the Quarterly Production Index.

This survey was conducted by delivering a questionnaire to all selected establishments, through the BPS Provincial or Municipality offices. Usually, not all establishments respond to this system. In such cases usually field enumerators would leave the questionnaires to establishment, and come back later to collect the questionnaire after it had been filled in. Sometimes the data could be collected through direct enumeration (without leaving the questionnaire) by the field enumerator (*Mantri Statistik*), especially for medium-sized establishments. Therefore, basically, this survey is conducted by applying direct enumeration method. Unlike the quarterly survey, in which data collection is conducted by delivering the questionnaires to all sample of establishments through BPS Provincial or Municipality offices or by direct enumeration involving field enumerators, the monthly survey is fully handled by the Sub-Directorate of Small-Scale and Cottage Industry Statistics. The data collection system of the monthly survey involves three ways: firstly, delivering questionnaires to establishments using facsimile facilities; secondly, by email; and thirdly, by post. Therefore, the monthly survey is conducted by applying a combination of the mailing, facsimile, and email system. The response rate of the annual survey ranges from 84 to 91 per cent of the target, with the response time around 18 months after the reference year.

Sampling unit: **Establishments without legal entity status**

Sample frame, including date ...

Small scale & micro establishments (SME) data are collected through the Integrated Survey of Small-scale Establishments (ISSE), which is a follow-up survey of the 1996 Economic Census. The survey is conducted on a sample basis. Since 1998 these surveys were integrated into the Integrated Establishment Survey (Survei Usaha Terintegrasi or SUSI 1998) that covers all non-agricultural sectors. The sampling unit of this survey is all

establishments without legal entity, irrespective of the number of employees, and including small and cottage industries which are based on the number of employees (i.e. with 5-19 employees for small industries and less than 5 for cottage industries). Due to the concept and terms being used, obviously the results of the ISSE can be used as a proxy to reflect the establishments belonging to the informal sector, although not in the full meaning of the terms.⁷ This survey covers around 120 thousand establishments of all non-agricultural sectors, of which around 28 thousand establishments are small and cottage industries.⁸

The ISSE applies two-stage sampling to select its representative establishments. The first is to select a number of enumeration areas from each of the two strata, namely, high-density economic stratum and housing area stratum, while the second stage is to select a number of establishments from each of the selected enumeration areas. A list of all establishments within the selected enumeration areas is constructed through listing, and PPS method was implemented in the establishment selection.

The number of SME units recorded by the 1996 Economic Census was 16.8 million excluding in the agriculture sector. In order to have more comprehensive figures on the characteristics of the existing SME units, a sample of 1.16 million establishments was selected in the census. The survey was not implemented in 1997, but the ISSE itself has been conducted every year since 1998. The sample size for 1998 was only 89,000 establishments. The survey was conducted only once during that year, while in 1999 the survey was conducted four times (quarterly), involving 118,000 establishments (i.e. to 29,500 samples per quarter). The latest survey was the 2000, 2001 and 2002 surveys, each of which employed 59,433 samples, or on average 14,850 samples for each quarter.

Data collection for this survey so far had been done periodically through a census or survey. The complete data collection of this Micro and Small Industry was done through the 1974/1975 Census of Industry. Then, it was done through the Survey of Small and Handicraft Industry in 1982, the 1986 Economic Census, and in 1991, 1993, 1994 and 1995 through the Survey of Small and Handicraft Industry. The data for 1996 was collected

through the 1996 Economic Census, meanwhile for the period of 1998 to 2005 the data were collected through the Integrated Establishment Survey (SUSI) and the 2006 data were collected through the 2006 Economic Census.⁹

ILO/EC Project “Monitoring and Assessing Progress on Decent Work” (MAP)

Monitoring and assessing progress towards decent work is a long-standing concern for the ILO and its constituents. Implemented by the ILO with funding from the European Union, the project “Monitoring and Assessing Progress on Decent Work” (MAP) helps to address this need. Over a period of four years (2009 to 2013), the project works with Ministries of Labour, National Statistical Offices, other Government agencies, Workers’ and Employers’ organisations and research institutions to strengthen the capacity of developing and transition countries to self-monitor and self-assess progress towards decent work. The project facilitates the identification of Decent Work Indicators in line with national priorities; supports data collection; and assists in the analysis of data on decent work in order to make them relevant for policy makers. The MAP publication series disseminates project outputs to a broad audience in the ten countries covered by the project and beyond.
